## **Canadian Technical Report of Fisheries and Aquatic Sciences**

Technical reports contain scientific and technical information that contributes to existing knowledge but which is not normally appropriate for primary literature. Technical reports are directed primarily toward a worldwide audience and have an international distribution. No restriction is placed on subject matter and the series reflects the broad interests and policies of Fisheries and Oceans Canada, namely, fisheries and aquatic sciences.

Technical reports may be cited as full publications. The correct citation appears above the abstract of each report. Each report is abstracted in the data base *Aquatic Sciences and Fisheries Abstracts*.

Technical reports are produced regionally but are numbered nationally. Requests for individual reports will be filled by the issuing establishment listed on the front cover and title page.

Numbers 1-456 in this series were issued as Technical Reports of the Fisheries Research Board of Canada. Numbers 457-714 were issued as Department of the Environment, Fisheries and Marine Service, Research and Development Directorate Technical Reports. Numbers 715-924 were issued as Department of Fisheries and Environment, Fisheries and Marine Service Technical Reports. The current series name was changed with report number 925.

## **Rapport technique canadien des sciences halieutiques et aquatiques**

Les rapports techniques contiennent des renseignements scientifiques et techniques qui constituent une contribution aux connaissances actuelles, mais qui ne sont pas normalement appropriés pour la publication dans un journal scientifique. Les rapports techniques sont destinés essentiellement à un public international et ils sont distribués à cet échelon. Il n'y a aucune restriction quant au sujet; de fait, la série reflète la vaste gamme des intérêts et des politiques de Pêches et Océans Canada, c'est-à-dire les sciences halieutiques et aquatiques.

Les rapports techniques peuvent être cités comme des publications à part entière. Le titre exact figure au-dessus du résumé de chaque rapport. Les rapports techniques sont résumés dans la base de données *Résumés des sciences aquatiques et halieutiques*.

Les rapports techniques sont produits à l'échelon régional, mais numérotés à l'échelon national. Les demandes de rapports seront satisfaites par l'établissement auteur dont le nom figure sur la couverture et la page du titre.

Les numéros 1 à 456 de cette série ont été publiés à titre de Rapports techniques de l'Office des recherches sur les pêcheries du Canada. Les numéros 457 à 714 sont parus à titre de Rapports techniques de la Direction générale de la recherche et du développement, Service des pêches et de la mer, ministère de l'Environnement. Les numéros 715 à 924 ont été publiés à titre de Rapports techniques du Service des pêches et de la mer, ministère des Pêches et de l'Environnement. Le nom actuel de la série a été établi lors de la parution du numéro 925.

## ABSTRACT

74 Ricard, D., Fishman, D., Beazley, L., Boivin, B., Emberley, J., Martin, R., McDermid, J., Rolland,  
75 N., Sean-Fortin, D. and Vergara, P. 2023. Design goals, technical implementation and practical  
76 use of Another data entry system (Andes). Can. Tech. Rep. Fish. Aquat. Sci. nnn: vi + 39 p.

77 A data entry system to facilitate the capture of information collected during scientific activities  
78 conducted by DFO Gulf Region was developed. The application, called “Another data entry  
79 system” (Andes) was implemented as a browser-based environment that facilitates its  
80 deployment in a variety of data capture scenarios. The design goals and implementation details  
81 of Andes are described, and a number of usage cases are presented. To promote endorsement  
82 of Andes by other scientific groups and to ensure the pereniality of the project, the application  
83 relies on Open Source software and uses a shared code development platform.

## RÉSUMÉ

85 Ricard, D., Fishman, D., Beazley, L., Boivin, B., Emberley, J., Martin, R., McDermid, J., Rolland,  
86 N., Sean-Fortin, D. and Vergara, P. 2023. Design goals, technical implementation and practical  
87 use of Another data entry system (Andes). Can. Tech. Rep. Fish. Aquat. Sci. nnn: vi + 39 p.

88 Un système d'entrée de données pour faciliter la saisie des informations recueillies lors des  
89 activités scientifiques menées par la Région du Golfe du MPO a été développé. L'application, qui  
90 s'appelle "Another data entry system" (Andes), a été mise en œuvre en tant qu'environnement  
91 basé sur un fureteur, ce qui facilite son déploiement dans une variété de scénarios de saisie de  
92 données. Les objectifs de conception et les détails de mise en œuvre d'Andes sont décrits, et  
93 un certain nombre de cas d'utilisation sont présentés. Pour promouvoir l'utilisation d'Andes par  
94 d'autres groupes scientifiques et assurer la pérennité du projet, l'application s'appuie sur des  
95 logiciels code source ouvert et utilise une plate-forme de développement de code partagé.

## 1 Introduction

97 The scientific activities conducted by the Atlantic regions of Fisheries and Oceans Canada  
98 (DFO) include ecosystem surveys, sentinel fisheries programs, coastal surveys, port sampling  
99 activities and many others. These monitoring programs require the collection of a wide variety of  
100 information about marine ecosystems and commercial fishery activities. To support the data  
101 collection during those surveys, paper-based systems were initially used during field work  
102 on research vessels, fishing vessels or at commercial ports. With the advent of computing  
103 capabilities, paper data sheets were digitized and the resulting data was stored for subsequent  
104 analyses. In the 1980s and early 2000s, a number of computer-based data entry systems were  
105 developed, in particular to support the activities of scientific ecosystem cruises where a variety  
106 of instruments are used to collect data. For trawl surveys, this meant a tool that could support  
107 the activities associated with processing the catches from the net, and that could also be used to  
108 manage survey activities while at sea. In the Maritimes and Gulf regions, the Groundfish Survey  
109 Entry (GSE) and later the Ecosystem Survey Entry (ESE) were deployed on workstations in  
110 the wet laboratory of research ships. These applications supported the capture of data about  
111 individual specimens, including the collection of length frequencies and more detailed sampling  
112 based on the survey goals and associated protocols. In the Québec Region, a similar tool called  
113 the "Module des Relevés de Recherche" (MRR) was developed and used to directly enter data in  
114 digital format on the research vessel.

115 The later versions of those data entry systems were built with Visual Basic for Applications (VBA)  
116 and relied on Microsoft Access databases. While highly functional, both the ESE and the MRR  
117 have important limitations:

- 118 • Despite being used over a local area network (LAN), these tools are not designed to work  
119 in a networked configuration.
- 120 • These tools are unilingual (French or English depending on the region) and their  
121 infrastructure does not readily support multiple languages in their user interface.
- 122 • Pre-.NET Visual Basic (VB), the main development frameworks used to build the  
123 applications, are dated programming languages. To adapt the software using modern  
124 libraries and Application Programming Interface (API) in VB will become increasingly  
125 difficult over time.
- 126 • The use of a Version Control System (VCS) is incompatible with the Microsoft Access  
127 applications that VB applications rely on. The absence of a VCS presents serious  
128 challenges for managing, disseminating and troubleshooting versions of an application  
129 across multiple platforms and is a major impediment for a collaborative approach to  
130 development.
- 131 • While these applications were built by DFO, multiple attempts to obtain support for these  
132 tools from Information Management and Technology Services (IMTS) were unsuccessful.  
133 This lack of support means that technicians often resort to either Excel or pen and paper to  
134 perform activities unsupported by the applications. Performing data entry using separate  
135 and disconnected methods means that the data has to be manually consolidated at a later  
136 date which is time-consuming and prone to error.

- 137 • The lack of a true server-side application (e.g. web application) meant that agile  
138 development was effectively impossible; especially in the context of a mission that was  
139 underway.
- 140 While the status quo was meeting the immediate data capture needs of scientists, a proactive  
141 stance towards addressing the above spurred the development of *Another data entry system*  
142 (*Andes*). This project effectively began in the summer of 2018 and the first field deployment of  
143 *Andes* took place in the fall of 2019 during the southern Gulf of St. Lawrence September survey.  
144 In its pilot year, *Andes* was used in parallel to the ESE on board *CCGS Teleost*.
- 145 A growing user-base that wish to add functional requirements can lead to a bad system design.  
146 This is especially true when affecting software components having different maturity levels.  
147 Development patterns such as contractual work specifically focused on adding a niche feature  
148 can easily lead to the accumulation of technical depth.
- 149 This report documents the design principles that guided the development of *Andes*, provides  
150 technical details about its implementation and details the usage cases encountered thus far. It  
151 provides guidelines for assessing the suitability of *Andes* for novel applications (e.g., other field  
152 activities and sampling programs) and discusses the ways in which the application could gain  
153 further adoption in supporting data collections activities within DFO.

## 154 2 Methods

155 The ESE was the starting point in the development of *Andes*. The replacement data entry  
156 software had to first replicate the proven functional capabilities of ESE. Early versions of *Andes*  
157 achieved those goals and the system was further developed over its usage by scientists in the  
158 Gulf Region. Other opportunistic design goals also existed, including the use of a contemporary  
159 software development environment, the ability to support multiple languages, flexibility in  
160 deployment and using a shared code development environment.

### 161 2.1 Technical Implementation of Design Goals

162 The following section outlines the user-requirements and design principles that played a role in  
163 decision-making during the development of *Andes*.

#### 164 2.1.1 Flexibility, Scalability and Reliability

165 The development environment used for the application must be a contemporary programming  
166 language with a proven track record for performance, usability and adaptability. Within the  
167 context of DFO Science, there is a high number of use-cases under which this application can  
168 be deployed. For example, the number of users might range from a single employee alone in  
169 the field to several dozen scientists, technicians and vessel personnel participating in a research  
170 cruise. Similarly, the application might need to be deployed on a stand-alone device or accessed

171 from within a LAN or even over a WAN. The application must be able to accommodate a wide  
172 range of practical scenarios.

#### 173 **2.1.2 Version Control / Source Control**

174 The utilization of a VCS is an indispensable component of a sustainable development workflow.  
175 Version management is especially important in the context of having concurrent instances of  
176 the application in production at any given time. Knowing the version of a production instance  
177 is necessary to resolve any issues that might arise. Similarly, databases and backup files are  
178 intimately linked to an application's version number. In order to successfully re-instantiate a  
179 backup file, the precise version under which it was produced must be known. The VCS will  
180 also provide an indispensable framework for the coordination, examination and integration of  
181 contributions from collaborators.

#### 182 **2.1.3 Unit Testing**

183 The application performance needs to be reliable, especially considering its potential to be  
184 deployed in remote field environments. The implementation of unit tests is a practical way to  
185 ensure the maintenance of core functionality over time. At one extreme, the addition of any code  
186 can be preceded by the creation of unit tests (i.e., test-driven development). This approach will  
187 maximize the stability of an application, but can hinder the momentum of a project, especially in  
188 its early stages. At the other extreme, application development in the complete absence of unit  
189 testing occurs at a relatively fast pace but will result in a project that is vulnerable to breaking in  
190 unexpected ways and one that is difficult to maintain and pass on to other developers.

#### 191 **2.1.4 Backup Strategy**

192 In all deployment scenarios, data of high business value will be captured and there is little  
193 to no tolerance for data loss. Accordingly, the application must have a way to facilitate the  
194 implementation of a robust data-backup strategy. Capturing numerous snapshots of the  
195 application (and database) is ideal since doing so provides redundancy as well as the ability  
196 to revert to a specific point in time. If possible, The backup files and snapshots should be stored  
197 on a volumes with some form of redundancy.

#### 198 **2.1.5 Customizable Protocols**

199 The flexibility of project leads to design, modify and report on their sampling protocol without  
200 depending on developers is very important. The application should allow users to provide  
201 a variety of detailed information based on their particular sampling protocols, without the  
202 need to change the application source code. Similarly, different protocols utilize different code  
203 conventions for the identification of biological catches. The application should offer the flexibility  
204 of users to utilize their preferred system of catch codes.

205 **2.1.6 Quality Control**

206 The implementation of quality control checks in a data entry application is of paramount  
207 importance. At a minimum, the following quality control checks should be leveraged:

208 **Sets** The application should ensure all the required fields on a given set card have been filled  
209 in. Users should also be warned if the set's start and/or end coordinates fall outside the  
210 expected sampling stratum (if applicable).

211 **Catches** The application should verify the validity of catches that do not have any data entry  
212 associated with them. This validation is important to help identify catches that might have  
213 been entered accidentally.

214 **Specimens** The application should flag specimens whose length falls outside an acceptable  
215 range. Similarly, a validation of the specimen's length-to-weight ratio should be performed.

216 **Observations** Individual observations are characterized by an observation type. Observation  
217 types should have predefined data types such as integer, float, string or categorical.  
218 The application should ensure that inputted observation values should never be left null  
219 and that they respect the data type of the corresponding observation type. In the case  
220 where an observation type (e.g., sex) has a set of defined categories (e.g., male, female,  
221 unknown), the application should ensure that any entered values fall within the set of  
222 available options.

223 **2.1.7 User Interface**

224 The user interface of the application can have a significant impact on user experience and  
225 onboarding. By ensuring the application has a modern and intuitive interface, the barriers  
226 related to onboarding new users are significantly reduced. Furthermore, an intuitive interface  
227 will reduce the need for extensive help documentation. Wherever extra annotation is required,  
228 documentation should be inserted directly in the application in the form of tool tips and help  
229 bubbles. By appealing to the end users' intuitions and by providing in-situ help documentation,  
230 we reduce the likelihood fields and features being used incorrectly.

231 **2.1.8 Reactivity**

232 In the context of being on a research vessel survey, data entry happens at a very fast rate and  
233 on numerous devices; often with multiple transactions per second. Accordingly, it is imperative  
234 that the application does not create a bottleneck for data entry and is able to keep pace with  
235 experienced technicians. The usage of a reactive javascript library in conjunction with an API  
236 would allow data entry to occur without webpages having to constantly refresh.

237 **2.1.9 Multilingualism**

238 The ability for users to choose the language of their choice in the application is of considerable  
239 importance to this project. Previous tools that have been used were unilingual, and this by itself  
240 would have limited the scope of their use in a national context.

241 **2.2 Usage cases**

242 A modularized application design would promote efficiency by allow multiple use-cases to  
243 leverage a core features and infrastructure such as authentication and authorization and many of  
244 the design elements listed above. The three major use cases that motivated this project are as  
245 follows.

246 **2.2.1 Ecosystem survey data entry**

247 To be used as the main data entry system for ecosystem survey operations. This module should  
248 allow the capture of all the information required by the sampling protocols of the survey (e.g.  
249 Hurlbut and Clay (1990)). This entails the capture of all information related to fishing activities,  
250 including ancillary variables such as weather, sea state, water temperature. Catch contents are  
251 sorted and identified during scientific surveys, so the data capture application needs to support  
252 users in obtaining catch weights and abundance by taxon, individual observation of a specimen's  
253 length, weight, maturity status, etc. The module should also flag to the users when specimens  
254 are to be collected, or when additional sampling requirements are present (e.g. collecting fish  
255 otoliths).

256 **2.2.2 Oceanographic metadata collection**

257 To be used to track and capture data and metadata from oceanographic operations such as  
258 CTDs and zooplankton nets. These operations can be conducted on stand-alone oceanographic  
259 missions or may be collected as complementary data during biological surveys. In the case  
260 of the former, the coordination of oceanographic data with the associated biological data is  
261 a burdensome logistical challenge. Historically, the different types of data were captured and  
262 recorded using separate systems that operated in complete isolation from one another. Ideally,  
263 this module could streamline the capture of oceanographic data and simplify its association with  
264 the corresponding biological data.

265 **2.2.3 Commercial port sampling**

266 To be used to support data collection during commercial port sampling activities (Benoît and  
267 Daigle 2007). This module is meant to be deployed on field tablets for scientific staff that collect  
268 data related to commercial fishing activities. A typical usage case is to obtain length frequency

269 samples from commercial landings, and to also obtain length-stratified hard parts used for age  
270 estimation, and also the collection of whole individuals for later processing in the laboratory. It is  
271 not expected that there would be any interaction between this module and the ones listed above.

272

### 3 Results

273 **3.1 Technical Implementation of Design Goals**

274 The architecture of Andes differs significantly from that of its predecessor. The basic system  
275 architecture of Andes is depicted in Figure 1. The application and its associated services are  
276 centralised on one or several servers and include: 1) a web-service for handling HTTP requests  
277 and responses; 2) a database service for storing data associated with the application; 3) a file-  
278 sharing service for handling the storage of backups and related files; 4) a printing service used  
279 for printing out specimen labels; and 5) a message-brokering service for handling asynchronous  
280 tasks. Client devices, such as data-entry workstations, no longer require the installation of  
281 anything more than a modern web browser; i.e., one that is capable of supporting HTML5 and  
282 ECMAScript 2016 (Javascript). Accordingly, this increases the range of devices and operating  
283 systems that may be used for accessing the application. For instance, the switch to using Andes  
284 has allowed the integration of mobile phones, tablets and linux workstations into the data entry  
285 workflow. Finally, the new configuration means multiple stations can simultaneously receive and  
286 enter data into the same Andes instance.

287 **3.1.1 Flexibility, Scalability and Reliability**

288 The [Django Web Framework](#) was selected for the backend of this application due to its  
289 modularized nature; virtually all aspects of the programming framework can be decoupled.  
290 Furthermore, the Django framework is written in pure Python language; an open-source,  
291 generalized object-orientated programming language that is popular for use in data-heavy  
292 applications. In addition to standard django templates, used to render HTML webpages to  
293 end-users, the web framework also contains an elaborate REST-API component. Django uses  
294 an Object Relational Model (ORM) to handle the data layer, and includes APIs for a variety of  
295 modern relational database management systems (i.e., PostgreSQL, MariaDB, MySQL, Oracle,  
296 SQLite, etc.). Several of the application's frontend templates contain reactive components  
297 implemented in Vue.js.

298 While web applications are most often used over a network, the Django library comes with  
299 a development web-server that permits users to serve and use the application locally. In  
300 this scenario, a single computer acts simultaneously as server and client. While there are  
301 important limitations to the use of the Django development web-server in a full-scale production  
302 environment, this configuration is adequate for stand-alone use-cases.

303 The architecture used by Andes creates networking requirements that were not previously  
304 present in the ESE and MRR. The server and the client devices must be connected to the same  
305 network. The network does not need to have access to the wide area network (i.e., internet)

306 connection. As long as they are connected to the same LAN, they can be configured for work  
307 together. This suits the networking environment on board remote vessels that can have sporadic  
308 connection failures with the wide area network.

309 The Andes application provides access to its various components based on an internal system of  
310 authentication and authorization. The credentials of a given user will affect what action they are  
311 able to do. For example, while the chief scientist are able to modify sampling requirements for the  
312 mission, other users are not.

### 313 **3.1.2 Version Control / Source Control**

314 It was decided to use [Git](#) as the VCS for this project due to the fact that it is both widespread in  
315 use and open-sourced. The remote repository for this project is currently hosted as a private  
316 project on the [Gulf Science organizational GitHub account](#). The project is additionally making  
317 use of GitHub infrastructure including, pull requests, issue management (e.g., bugs, feature  
318 requests and general enhancement requests), security alerts and version releases. The Andes  
319 documentation is also being served using GitHub Pages and can be access [here](#)

### 320 **3.1.3 Unit testing**

321 For Andes development, we use a mixture of test-driven development for critical components  
322 of the application, and are also continually adding unit tests for more user-specific components.  
323 Using the built-in Python / Django testing framework, this strikes a middle ground between the  
324 two approaches described in the above section. While the goal is not to implement test-driven  
325 development for the application, the use of unit tests is highly encouraged, especially to back up  
326 the core functionality of the application.

### 327 **3.1.4 Backup Strategy**

328 The Andes application has the capability to perform manual and automatic backups. These  
329 backups consist of two parts: a `gls{json}` export of the entire database and the recording of the  
330 current version of the application (i.e., the git hash). The structure of the application models will  
331 change over time and thus, so will the structure of the data. Accordingly, in order to re-instantiate  
332 a particular data snapshot, it is critical to know the precise version from which it was exported.  
333 This combination of data export and git version number, gives users the perpetual ability to  
334 recreate the exact application environment from the time of the snapshot; no matter how much  
335 the application has change in the interim. In the application, backups are automatically created  
336 upon closing sets. However, users also have the ability to manually trigger a backup at anytime.

337 **3.1.5 Customizable protocols**

338 Andes provides project leads the ability to create and modify sampling protocol through the  
339 user interface. By doing so, project leads are able to shape the flow and control the behaviour of  
340 the application during data entry. This including deciding which fields to display in a form (e.g.,  
341 set cards), importing stations and other geographical features (e.g., sampling strata, NAFO  
342 areas, Marine Protected Area (MPA)s, etc.) and the quotas and observation fields associated  
343 with different catch items. Examples of catch-specific sampling requirements that can be  
344 programmed by project leads can be found in Table 1.

345 Andes also allows users to specify a preferred system of catch codes by attaching the code  
346 collection to a sampling protocol. When a given protocol is active, all catch item are reference by  
347 their corresponding entry in the attached catch collection list.

348 **3.1.6 Quality Control**

349 Andes successfully implements a suite of quality control checks. All quality control flags that  
350 are raising during data entry are appended to a report and require sign off before a set can be  
351 closed.

352 **Sets**

353 The Andes provides very clear feedback regarding the completeness status of a given set. Flags  
354 are raised if a set's start and/or end coordinates are outside the expected sampling stratum;  
355 additionally, an alarm is sounded in the bridge console app when deviating from the desired  
356 stratum in real-time. The bridge console also provides personnel with fishing timers and tow  
357 distance displays (see Figure 2).

358 Andes will flag when the tow distance as calculated by the cruise track, differs from the tow  
359 distance as calculated by a straight line between the start and end coordinates by more than  
360 5%. Andes will flag when the start or stop coordinates of a set are not within the expected NAFO  
361 area (if applicable).

362 **Catches**

363 Flags are generated for catches that do not have any data entry associated with them. In  
364 addition to this, Andes will flag when the weights entered for baskets that are considered  
365 suspect. This is determined by either the default maximum basket weight (mission level), or  
366 the maximum basket weight for a given species. Andes will also flag when the difference of  
367 total weight of *sampled* basket differs by more than 25% from the total calculated specimen  
368 weight. The total calculated specimen weight is a combination of actual weights (when collected)  
369 and those which were estimated from length measurements. The latter is achieved by using  
370 regression coefficients estimated from historical length ( $L$  in centimeters) and weight ( $W$  in  
371 grams) observations using the following equation:

$$W = aL^b \quad (1)$$

372 Andes offers the option to specify separate regression coefficients ( $a$  and  $b$ ) for males, females or

373 unspecified individuals (as shown in Figure 3).

374 A recent version of Andes implemented a new optional layer of quality control. This feature  
375 allows project leads to assign allow-lists and restrict-lists, commonly known as “whitelists” and  
376 “blacklists”, to a mission or to a specific geographic feature (e.g., a stratum). In this way, the  
377 validity of each catch entered into a set can be assessed. For example, if a catch being recorded  
378 is *not* on the that set’s associated allow-lists, the end user will be notified that this is an unusual  
379 observation and will be prompted to collect documentation. Similarly, if a project lead adds a  
380 catch to the mission’s restrict-list, users who enter this catch will receive a warning message,  
381 asking them to double-check the assignment. This is useful when project leads want to limit  
382 the usage of certain taxa during data entry, e.g., *Alosa sp* is preferred over the use of *Alosa*  
383 *pseudoharengus*.

### 384 **Specimens**

385 Specimen lengths and length-to-weight ratios are validated against the parameters entered in the  
386 sampling requirements for that catch. Acceptable length-to-weight are assessed by comparing  
387 the actual weight to the estimated weight, as described in the section above. Additionally, Andes  
388 will flag when there is a mismatch between fish maturity and somatic length. Project leads can  
389 specify mature length thresholds for males, females or unspecified individuals in the sampling  
390 requirement of a given species (as shown in Figure 4).

### 391 **Observations**

392 When entering observations, Andes enforces the data type of the corresponding observation  
393 type; invalid entries are not accepted. When entering an observation for an observation type  
394 that has categories, Andes will display the list of options to the end user and inhibit users from  
395 entering invalid selections. Andes will also ensure observation types are not left blank, however  
396 NaN entries are permitted when a particular observation is meant to be skipped. Certain  
397 observation types are meant to be unique, e.g., unique tag number. If this is flagged at the level  
398 of the observation type, end users will be notified if there is a violation of this structure.

#### 399 **3.1.7 User Interface**

400 The frontend of the application is built in HTML5, javascript and Cascading Style Sheet. Most  
401 users will be familiar with the flow and functionality of a web browser and will be comfortable  
402 navigating and entering data into a website. Facilitated by the Django model and form classes,  
403 all controls (i.e., fields) on the website contain verbose descriptions and help text. The [Bootstrap](#)  
404 [v5.0](#) CSS and javascript libraries were utilized in order to give the application a sleek, modern  
405 look and to ensure compatibility with different types of devices (e.g., personal computers, tablets  
406 and mobile devices). The Bootstrap library also provides palatable styles for displaying help text  
407 in the form of popovers and tooltips.

408 **3.1.8 Reactivity**

409 The [Django REST framework](#) was used to construct the WebAPI component of the application.  
410 The project takes a hybrid approach, combining the use of standard Django views and Vue.js  
411 frontend applications embedded in the templates. The latter were used to avoid the need for  
412 constantly reloading webpages and to optimize the flow of traffic across the network. Reactive  
413 javascript frontend applications also provide a better experience from the point of view of an  
414 end-user.

415 **3.1.9 Multilingualism**

416 The Django framework has excellent support for internationalization and localization, including  
417 the translation of text and the formatting of dates, times and numbers. It achieves this using a  
418 system of “hooks” used by developers to indicate which parts of the code should be localized.  
419 See [Django - Internationalization and localization](#) for more details on this process. In our  
420 application, an end-user can toggle between English and French by simply clicking on a button.  
421 In this way, each client can view the application in the language of their choice.

422 **3.2 Usage cases**

423 The Andes Django project contains multiple apps that loosely correspond to the different use  
424 cases defined in the above methods section. The different modules can be clearly observed in  
425 the index page of the site (Figure 5. As noted above, the access to different apps is determined  
426 by a system of authentication and authorization. Accordingly, the index page will appear different  
427 to users depending on the permissions they have been granted.

428 While Andes has been implemented using a modular design, there is a core set of components  
429 that are used across modules. This true at the level of the database, where in addition to a  
430 number of shared tables, sub-modules will have tables that are specific its specific use case.  
431 For example, the Mission table is used across several modules however the Specimen module is  
432 specific to the Ecosystem Survey application.

433 Similarly, Andes has apps that are used across multiple user scenarios; in particular, the  
434 Bridge Console (Figure 6) and the Cruise Dashboard (Figure 7). These apps display high-  
435 level information to end users such as queued stations, vessel speed, position and heading  
436 and various summaries of Science activities that are underway or that have already taken place.  
437 All core pages of the application can be toggled to night mode, as desired.

438 **3.2.1 Ecosystem survey data entry**

439 The Ecosystem Survey app is the main entrypoint that technicians will use to input survey  
440 data. A depiction of the main tables involved in the Ecosystem data entry application, and their  
441 relationships are displayed in Figure 8. This component of Andes replicates the capabilities

442 of the ESE for capturing detailed information on length, weight, ageing material, maturity, etc.  
443 about fish and invertebrate specimens. This app, typically accessed from the wet laboratory of a  
444 survey vessel, is used for all entry of data related to measurements and observations of marine  
445 organisms. New catches are first entered into the Active Set page, as portrayed in Figure 9.  
446 The Active Set page accepts regional catch codes as a way to input new catches into a set.  
447 If a code is not known, a search feature is available. Next, baskets and their corresponding  
448 weights and statuses (e.g., sampled vs. not sampled) are then entered into the Catch Card page  
449 (Figure 10). Finally, specimens are entered into the Data Entry page (Figure 11). As the data  
450 entry progresses, users are dynamically prompted with observation fields that follow the catch-  
451 specific sampling protocol. An overview of the sampling protocol is displayed on the right-hand  
452 side of the Data Entry page.

453 The Shrimp Ecosystem Survey application resulted from the early adoption of Andes in the  
454 Québec region. The niche workflow requirements of shrimp survey operations justified the  
455 creation of its own Andes module.

456 As noted above, the Bridge console is used by navigation officers in the wheelhouse (usually  
457 set up on a tablet) is used to input fishing set metadata. The data entry occurs in two ways: 1)  
458 by directly editing the set form (a.k.a. the set card); and/or 2) via the Fishing Console, which is  
459 displayed in Figure 6. The Fishing Console can capture a number of different events that take  
460 place during fishing as well as information coming from sonar and trawl mensuration system  
461 sensors (e.g., Scanmar system).

462 Part of the task-specific suite of utilities is a forecasting tool that provides real-time prognostics  
463 of survey completion targets based on assumed transit speeds and time spent fishing and  
464 processing the trawl catches (Figure 12). This feature provides a useful tool for the chief scientist  
465 to evaluate different sampling objectives and survey route. As the conditions change regularly  
466 during a survey, this tool links with the set manager to provide an estimate of the amount of time  
467 required to complete planned stations. This tool can be used for short-term planning (i.e. a day's  
468 worth of sampling) or longer-term planning (i.e. a mission's worth of sampling).

469 Another task-specific utility is the completion map which shows what strata have been completed  
470 based on target and minimum number of sets per stratum. This map provides the chief  
471 scientist with a clear visual depiction of what has been accomplished, and what remains to be  
472 accomplished, during the survey. The number of sets conducted in each stratum is compared to  
473 the minimum and target number of sets per stratum to determine the colour that each stratum will  
474 appear in the progress map (Figure 13).

### 475 **3.2.2 Oceanographic metadata collection**

476 The Oceanography app is a stand-alone component of the application that is capable of being  
477 deployed independently of the Ecosystem Survey module. This module is used to track and  
478 record the deployment of CTDs, plankton nets, Argo floats and other oceanographic equipment  
479 (Figure 14. Basic metadata, such as the location and date/time of deployment and recovery  
480 events, can be collected for each activity. Certain oceanographic activities allow deeper layers  
481 of metadata collection, such as the tracking of water samples from CTDs ((Figure 15). The  
482 simplified Entity Relationship Diagram of the Oceanographic module of Andes is presented

483 in Figure 16.

484 **3.2.3 Commercial port sampling**

485 Andes was adapted to support port sampling activities where technicians obtain length frequency  
486 samples from commercial fishing activities. The protocols used in the Port Sampling app are  
487 much simpler than those belonging to the Ecosystem Survey app. Through the protocols,  
488 user are able to control collection quotas (e.g., “keep two specimens per bin”), the flow of data  
489 entry (e.g., which field should be displayed in the sample form) and the layout of the data entry  
490 page (e.g., should the length bins be organized in a vertical or horizontal configuration) (see  
491 Figure 17). Typically, production instances of this app are deployed on ruggedized field tablets  
492 that are suitable for use in wet environments. The design of the user interface is simple and  
493 intuitive; where each length bin is a large button on the display. As specimens are tallied, the  
494 corresponding buttons on the touchscreen are pushed. A screenshot of the data entry page is  
495 presented in Figure 17. The various tables of the Port Sampling application and how they relate  
496 to one another is shown in Figure 18.

497

## 4 Discussion

498 The current capabilities of Andes have evolved over the last three years where the system has  
499 been used to support field activities in the Gulf Region. The software has also been used by the  
500 Maritimes and Quebec regions of DFO.

501 Since its initial deployment during the 2020 September survey in the southern Gulf of  
502 St. Lawrence, the capabilities and performance of Andes have improved. The forecasting tool  
503 and progress map presented in this report were not in the original deployment of the application  
504 and were added during the cruise based on the needs of scientific and Canadian Coast Guard  
505 (CCG) personnel.

506 The reporting facilities provided by Andes were developed to support the many users of the  
507 data collected during scientific activities. Two types of reports are available for Andes: 1) reports  
508 meant to be used during field activities and 2) reports meant to be used after field activities are  
509 completed.

510 If a vessel is located within range of cellular phone signals, it is possible to make Andes  
511 accessible via the internet. This has some important advantages however exposing an IP to  
512 the internet always come with security risks that have to be mitigated.

513 Andes is designed so that data backups are immune to the potential pitfalls of relying on earlier  
514 versions of required packages. Having backups that are associated with a specific git version,  
515 which includes a comprehensive list of all dependencies and an exact match of the application  
516 data model, allows users to readily bring back Andes to where it was at the time of the backup.  
517 Users can then access the reporting features that will allow them to create a version of the  
518 required data that suits their needs and facilitates inclusion in existing relational database  
519 management systems or other types of data solution.

520 When present, the client-server separation lends itself nicely to be adaptable to new  
521 requirements. One can potentially expand upon the *system* with minimal changes to Andes by  
522 interacting directly with its exposed REST-API. For example, an imaging system can be aware of  
523 current GPS coordinates or current Set / Station. Photos or videos acquired by such an imaging  
524 system could automatically append these as metadata, or even add media identifiers directly to  
525 the database as they are captured.

526 Most modern vessels will already provide the minimum necessary networking infrastructure  
527 necessary for system deployment where connectivity between a dry laboratory, a wet laboratory  
528 and the ship's wheelhouse are necessary. In the case where it doesn't, this requirement can be  
529 met relatively easily using inexpensive consumer-grade networking equipment (wireless router,  
530 switch, etc.). However, installing an ad-hoc network for scientific needs in a vessel may lead to  
531 code violations there we urge Andes users to collaborate with vessel management body like the  
532 CCG or chartering authority.

533 The addition of allow-lists and restrict-lists was an important addition to Andes that came out of a  
534 Regionalization workshop that took place in December 2022 at the Gulf Fisheries Center. While  
535 these features will help improve the quality of data collected, it is important that if implemented,  
536 they should be detailed explicitly in the survey sampling programme. For example, if project  
537 leads add certain catch items to the restrict-list, this should be mirrored in the survey sampling  
538 programme.

539 While there is always an effort to make the user interface intuitive and self-explanatory, there is  
540 still the need to maintain documentation for the project. The Andes docs are maintained through  
541 GitHub Pages and are publicly available here: <https://dfo-gulf-science.github.io/andes/>

#### 542 **4.1 Integration of Andes with existing data repositories**

543 Andes is a standalone application with an underlying relational database management system,  
544 and the data collected during research activities must be extracted from the application and  
545 integrated into existing databases. This step has proven to be challenging but has also led to  
546 close inter-regional collaboration since the challenges associated with integration were shared by  
547 the different groups involved.

#### 548 **4.2 Future Directions**

549 Onboarding efforts for coastal surveys (scallop, sea-cucumber, whelk) is underway.

- 550 • Atlantic Zone Monitoring Program (AZMP) / oceanographic surveys
- 551 • use for ecosystem surveys by multiple DFO regions
- 552 • use of barcodes and/or QR codes for identifying and tracking down samples (e.g. otoliths,  
553 tissue samples, ...)
- 554 • imaging system (as per proposal from Curtis Dinn)

555 **4.3 Governance**

556 Andes does not currently have a well-defined governing body. This makes it, as well as any  
557 project without governance, vulnerable. To alleviate this situation, we ask that this technical  
558 document as well as the developer's guide be considered when outsourcing development efforts  
559 towards Andes. This will ensure that the core vision is maintained and that software sustainability  
560 principles are upheld.

561 Andes reached a critical point in its lifecycle. It has been used as the main data entry strategy in  
562 numerous missions over the span of a few years. Although new features can always be added,  
563 its core functional requirements can now be locked-in. The boundaries are now well-defined and  
564 described in this report.

565

## 5 Acknowledgments

566 We thank all DFO personnel who were involved in the early testing and deployment of Andes  
567 prior to and during the 2020 southern Gulf of St. Lawrence ecosystem survey. We thank the  
568 Gulf Region publications coordinator, Dr. Jeffery Clements, for his assistance with getting this  
569 document published.

Figure 2. A screenshot of Andes Fishing Console within the Bridge App. This screenshot shows some quality control validation features including: the fishing timer, the distance display and an alarm message for when the vessel is travelling outside the target stratum. On the bottom left of the screenshot, output from the net monitoring system is displayed. The large buttons in the center of the display are used to trigger fishing events.

## Length-to-Weight Ratio

### A+B coefficients (weight = a × length<sup>b</sup>)

	A	B
Unspecified	0.00561 The A regression coefficient in the relationship between length and weight for unspecified sex.	3.125999999 The B regression coefficient in the relationship between length and weight for unspecified sex.
Male	0.006227218 The A regression coefficient in the relationship between male length and weight.	3.096902077 The B regression coefficient in the relationship between male length and weight.
Female	0.006141017 The A regression coefficient in the relationship between female length and weight.	3.101193464 The B regression coefficient in the relationship between female length and weight.

### Tolerance threshold for length-to-weight ratio (%)

25

The higher the threshold, the more relaxed Andes will be in raising warnings

**Wait for sex before testing length-to-weight ratio?** If this is set to true, Andes will only check length-to-weight ratio after sex has been observed.

Figure 3. A screenshot of the “Length-to-Weight Ratio” section of the sampling requirement form. Andes offers the option to specify regression coefficients for males, females or unspecified individuals to be used in quality control.

**Mature Length**

**Mature length threshold**

Unspecified	30 What is the min length of a mature individual of this species before which a user should receive a warning?
Male	Mature length (male)
Female	Mature length (female)

**Maturity observation type**

Maturity

**Code used to signal an immature specimen**

1  
Only applicable if a maturity observation type is provided above

This screenshot shows the 'Mature Length' section of a sampling requirement form. At the top, there's a blue header bar with the title 'Mature Length'. Below it, a table is used to specify mature length thresholds. The first row is for 'Unspecified' individuals, showing a value of '30' and a note asking what the minimum length is for a mature individual of the species. The second row is for 'Male' individuals, and the third row is for 'Female' individuals. Underneath the table, there's a section for 'Maturity observation type' with a dropdown menu set to 'Maturity'. At the bottom, there's a field for 'Code used to signal an immature specimen' containing the number '1', with a note stating it's only applicable if a maturity observation type is provided.

Figure 4. A screenshot of the “Mature Length” section of the sampling requirement form. Andes offers the option to specify mature length thresholds for males, females or unspecified individuals to be used in quality control.

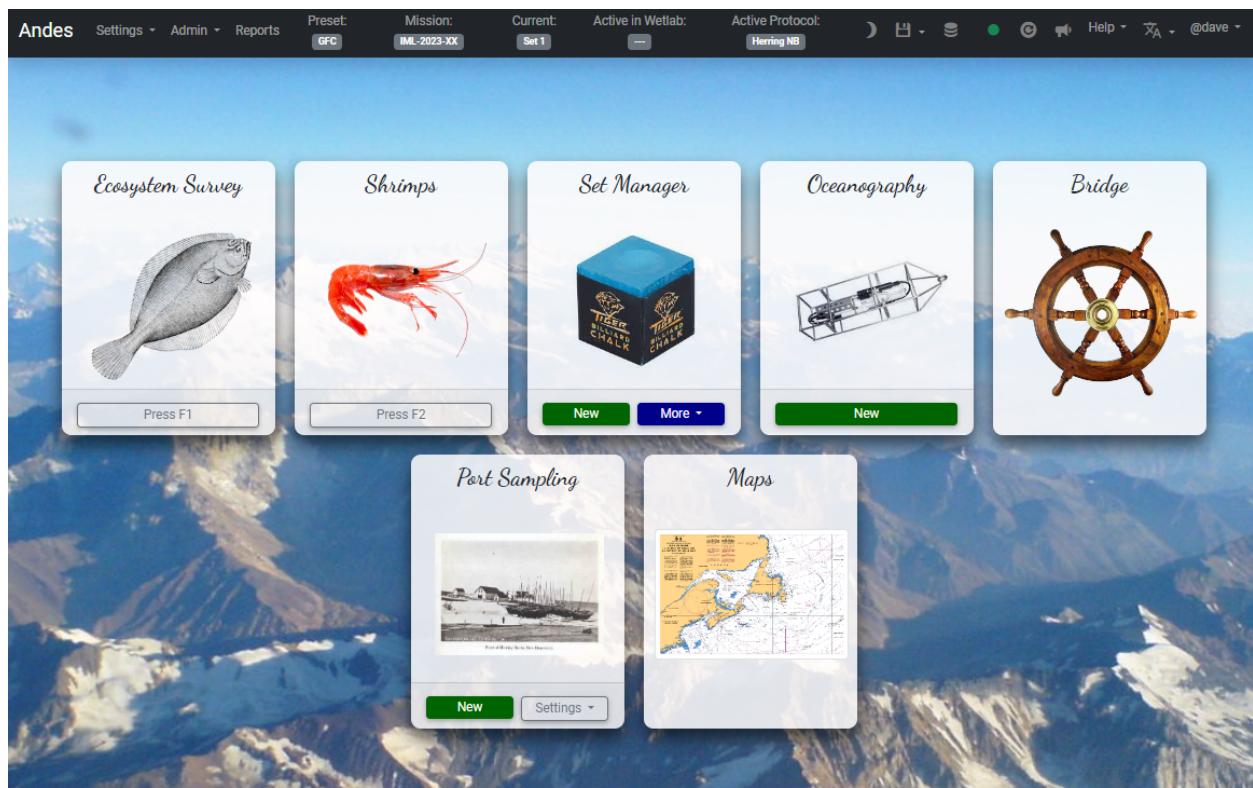

Figure 5. A screenshot of the main index page of Another data entry system (Andes) showing the principal modules of the application. Which are displayed on the index page will depend both the users permissions and profile.

Figure 6. A screenshot of the Andes Bridge console. This app is used by bridge personnel across multiple user scenarios. This dashboard is a critical link in the communication between the scientist and crew personnel. An example of this is the station list; as a chief scientist plans out his or her route, queue stations and the associated activities will appear in the Bridge console. The Bridge console is also used by bridge officers to trigger the start and ends of operations and to input set metadata.

22

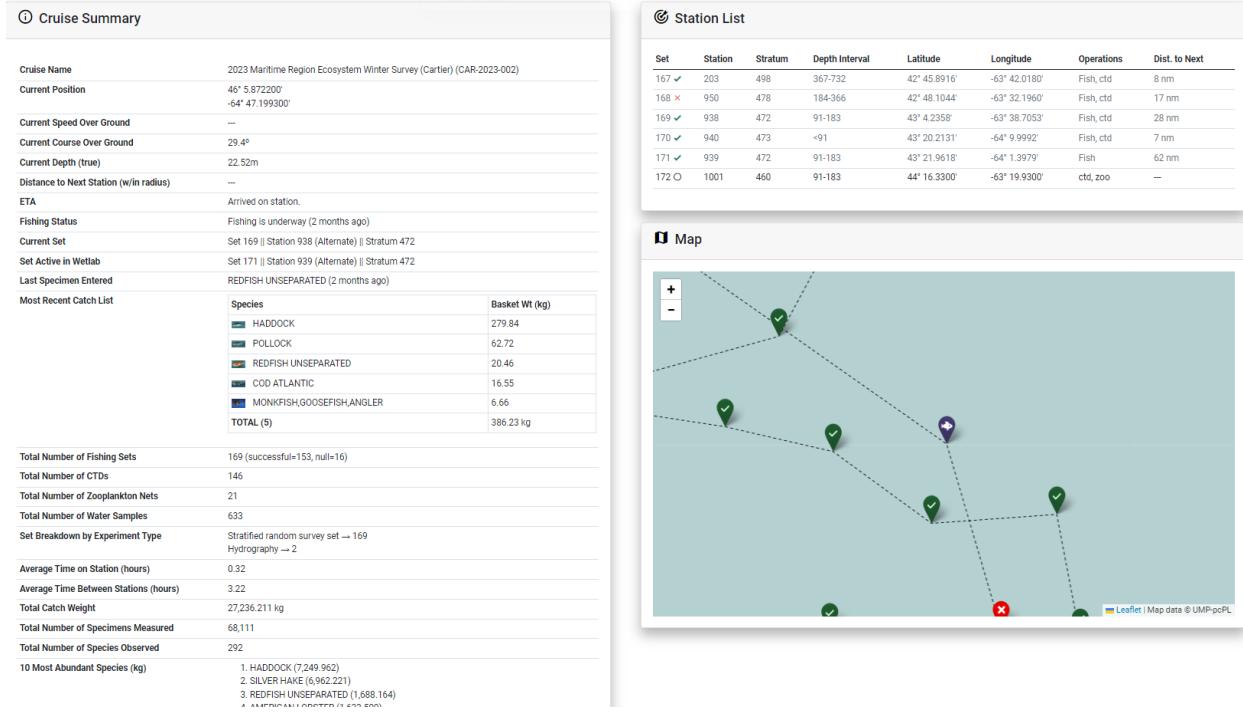

Figure 7. A screenshot of the Andes Cruise Dashboard. This dashboard helps to communicate queued stations, fishing activities underway and estimated times of arrival to science staff and crew personnel. The dashboard also displays high level summaries of Science activities that were conducted.

Sampling Requirement for COD ATLANTIC

Length: → Fork length, centimeters (cm)  
 Weight: → Total, grams (g)  
 Minimum length: → n/a  
 Maximum length: → 140 cm  
 Mature length: →  
 Rounding rule: → round up to the nearest whole  
 Always collect sex? → No

There is 6 collections under this requirement.  
 Press F12 to view the details.

Figure 17. A screenshot displaying the Port Sampling app protocol form. The selections made in this form will affect the behaviour of the app during data entry.

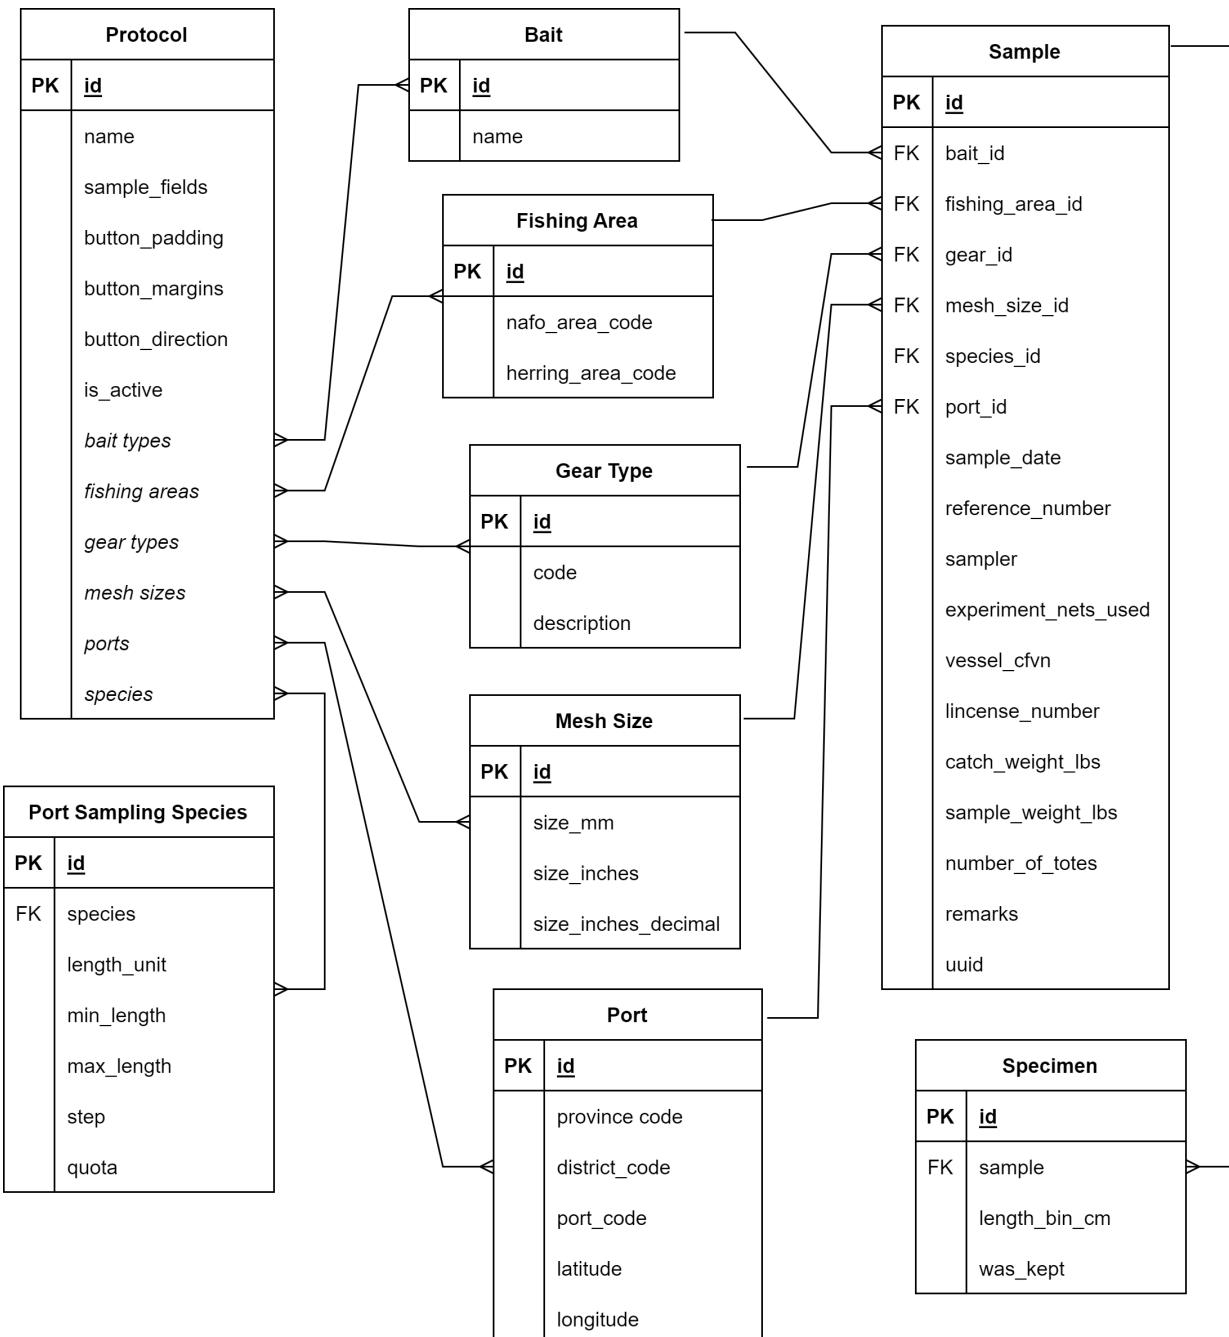

Figure 18. A simplified entity relationship diagram of the data model used by the Port Sampling app of Andes.

579

## 9 Acronyms

580 **Andes** Another data entry system.

581 **API** Application Programming Interface.

582 **AZMP** Atlantic Zone Monitoring Program.

583 **CSS** Cascading Style Sheet.

584 **DFO** Fisheries and Oceans Canada, formerly the Department of Fisheries and Oceans.

585 **ERD** Entity Relationship Diagram.

586 **ESE** Ecosystem Survey Entry.

587 **GSE** Groundfish Survey Entry.

588 **html5** Hypertext Markup Language.

589 **IMTS** Information Management and Technology Services.

590 **LAN** Local Area Network.

591 **MPA** Marine Protected Area.

592 **MRR** Module des Relevés de Recherche.

593 **REST** Representational state transfer (REST).

594 **REST-API** Representational state transfer (REST) Application programming interface (API).

595 **VCS** Version Control System.

596

## 10 Glossary

597 **Andes** Another data entry system is an application developed by Fisheries and Oceans Canada  
598 to support data collection for a variety of scientific programs.

599 **Andes lead** A person with a functional understanding of the inner workings of Andes. This  
600 person has the knowledge and user-rights that permit them to configure a Mission, define  
601 a Sampling Protocol, Sampling Requirements, etc.

602 **API** An Application Programming Interface (API) is a particular set of rules and specifications  
603 that a software program can follow to access and make use of the services and resources  
604 provided by another particular software program that implements that API.

605 **AZMP** The Atlantic Zone Monitoring Program collects and analyses the biological, chemical  
606 and physical oceanographic field data in the four Altantic regions of Fisheries and Oceans  
607 Canada.

608 **Bridge** The Bridge app is meant to be used by the navigation officer while the fishing officer  
609 deploys and retrieves the trawl. The operator inputs fishing events (eg., net deployed,  
610 doors deployed, winches locked, net on bottom, haul back, net off bottom, doors recovered,  
611 net recovered) or actions (eg., net on/off bottom) directly to Andes via the Bridge app. .

612 **Catch** A table of the Ecosystem Surveys app. A Catch table contains a link to Set and Species  
613 entries, as well as an optional: specimen count, unweighted baskets, relative abundance  
614 category and an invertabrate catch ratio. Catches can be subdivided into sub-catches  
615 having a parent-children relationship.

616 **Catch Card** Catch details recorded prior to detailed sampling.

617 **CCG** The Canadian Coast Guard.

618 **Closed Set** An Open Set Can be closed if the data it contains (eg, from Catch Card) does not  
619 trigger a Set Flag.

620 **Configuration Preset** Configuration for a particular deployment scenario. Configuration presets  
621 include details on the backup locations, and peripherals like GPS, sonars, label printers,  
622 etc. .

623 **Cruise** Same as Mission.

624 **CSS** A Cascading Style Sheet is a style sheet language used for describing the presentation of  
625 a document written in a markup language such as HTML or XML.

626 **CTD** Conductivity, salinity and density.

627 **Current Set** The Set that is currently occurring in time. It has begun and is not finished. There  
628 can only be one Current Set at a time.

629 **DFO** Fisheries and Oceans Canada is a department of the Government of Canada that is  
630 responsible for developing and implementing policies and programs in support of Canada's  
631 economic, ecological and scientific interests in oceans and inland waters.

632 **Ecosystem Survey** The Ecosystem Survey app is used to as the main data input interface. .

633 **ESE** The Ecosystem Survey Entry replaced the GSE in the early 2000s.

634 **Fishing Event** An event related to fishing activty of Set. Metadata such as GPS coordinates  
635 and time to are associated with the following event types: *net deployed, doors deployed,*  
636 *warp deployed, net on bottom, haul back, net off bottom, door recovered, net recovered,*  
637 *and aborted*. A Set may contain a list of such event types. The Fishing Events are added  
638 to the Set by a crewmember using the Bridge application. .

639 **GSE** The GSE is a data entry tool developed in the 1980s.

- 640 **html5** The Hypertext Markup Language is the standard markup language for documents  
641 designed to be displayed in a web browser.
- 642 **IMTS** Information Management and Technology Services is the IT branch of DFO.
- 643 **javascript** Javascript is a programming language that is one of the core technologies of the  
644 World Wide Web, alongside HTML and CSS.
- 645 **JSON** JavaScript Object Notation. The JSON format is a popular way to serialize data and is an  
646 alternative to the CSV (comma-separated values) and XML (eXtensible Markup Language)  
647 formats.
- 648 **LAN** A series of computers connected to each other and capable of communicating with each  
649 other over wired or wireless connections.
- 650 **Mission** Same as Cruise .
- 651 **Open Set** A Set that has not been closed. All new Sets will start in an open state and will  
652 remain so until closed. Sets that are activated will automatically be opened. The Current  
653 Set is always open.
- 654 **ORM** Object Relational Mapping are an abstraction of relational entities (database tables) as  
655 objects.
- 656 **Port Sampling** Scientific program collecting samples from commercial fishing activities.
- 657 **REST-API** Representational state transfer (REST) Application programming interface (API) is  
658 an API that follows the REST software architectural style, created to guide the design and  
659 development of the architecture for the World Wide Web.
- 660 **Sampling Requirements** The species-specific requirements for samples to be collected during  
661 a scientific cruise.
- 662 **Sampling Protocol** The detailed description of what data is to be collected during a scientific  
663 cruise.
- 664 **Set** A Set contains all fishing activity and sampling results for a particular Station .
- 665 **Set Flag** A flag used to indicate that the data contained within the set has failed to pass a  
666 specific validation tests. Closing an Open Set with active flags can be done by overriding  
667 the validation mechanism.
- 668 **Species** An identifiable taxon that can be assigned to a species code.
- 669 **Station** A target location specified by coordinates where a scientific activity is to take place.
- 670 **VB** Pre-.NET Visual Basic for Applications is the early version of Microsoft VBA and is no longer  
671 supported or updated by Microsoft.

672   **VBA** Visual Basic for Applications is a programming language built into most desktop Microsoft  
673       Office applications. More details can be found on the Wikipedia page for this programming  
674       language and from Microsoft.

675   **VCS** A Version Control System records changes to a file or set of files over time so that specific  
676       versions can be recalled later. For example, git is a VSC.

677   **Vue.js** A JavaScript framework for building reactive user interfaces. <https://vuejs.org/>.

678   **WAN** wide-area network, such as the internet.

679

## APPENDIX A Tasks for administrative user

680 Prior to a survey, a number of configurations must be done for Andes to function as intended.  
681 At a minimum, the following information must be ingested by Andes in order for a mission to  
682 take place:

- 683 1. Strata polygons  
684 2. List of stations  
685 3. Species list  
686 4. Sampling requirements

687 **APPENDIX B Further resources about Andes**

688 The main git repository supporting the development of the application is hosted by IMTS. The  
689 following resources can be found there:

- 690 • deployment checklist  
691 • species lists for Gulf, Maritimes and Quebec  
692 • strata polygons  
693 • sampling requirements from previous surveys
